Report Review Notes

Data Description:
- Summarize the THI selecting process as well as the first two paragraphs. Perhaps you can re-purpose the details of selection methods for the critical parameters under the ` Final Comparison Groups` section which might help to focus on the most solid and well-founded analysis.
- Adding more description about replacement to give audience a better understanding of the process

Methods:
- Adding the plots for your hyperparameter tuning to the Appendix section. It may be beneficial to see how the changes in k values yield different values for your objective function (i.e. winning probabilities of actor cows). You could also perhaps elevate the robustness of the hyperparameter tuning with validation sets.

Results:

- Going beyond the current method based on the results? For example, a small paragraph on further actions that could be taken given the results might be of interest to further bring strength to your conclusions vs. just relying on a single coefficient metric.
